Deep Think

How we design agents

One visual and interaction system — chrome, color, questions and reports — that every agent inherits, whatever it does.

Agent design system · August 2026

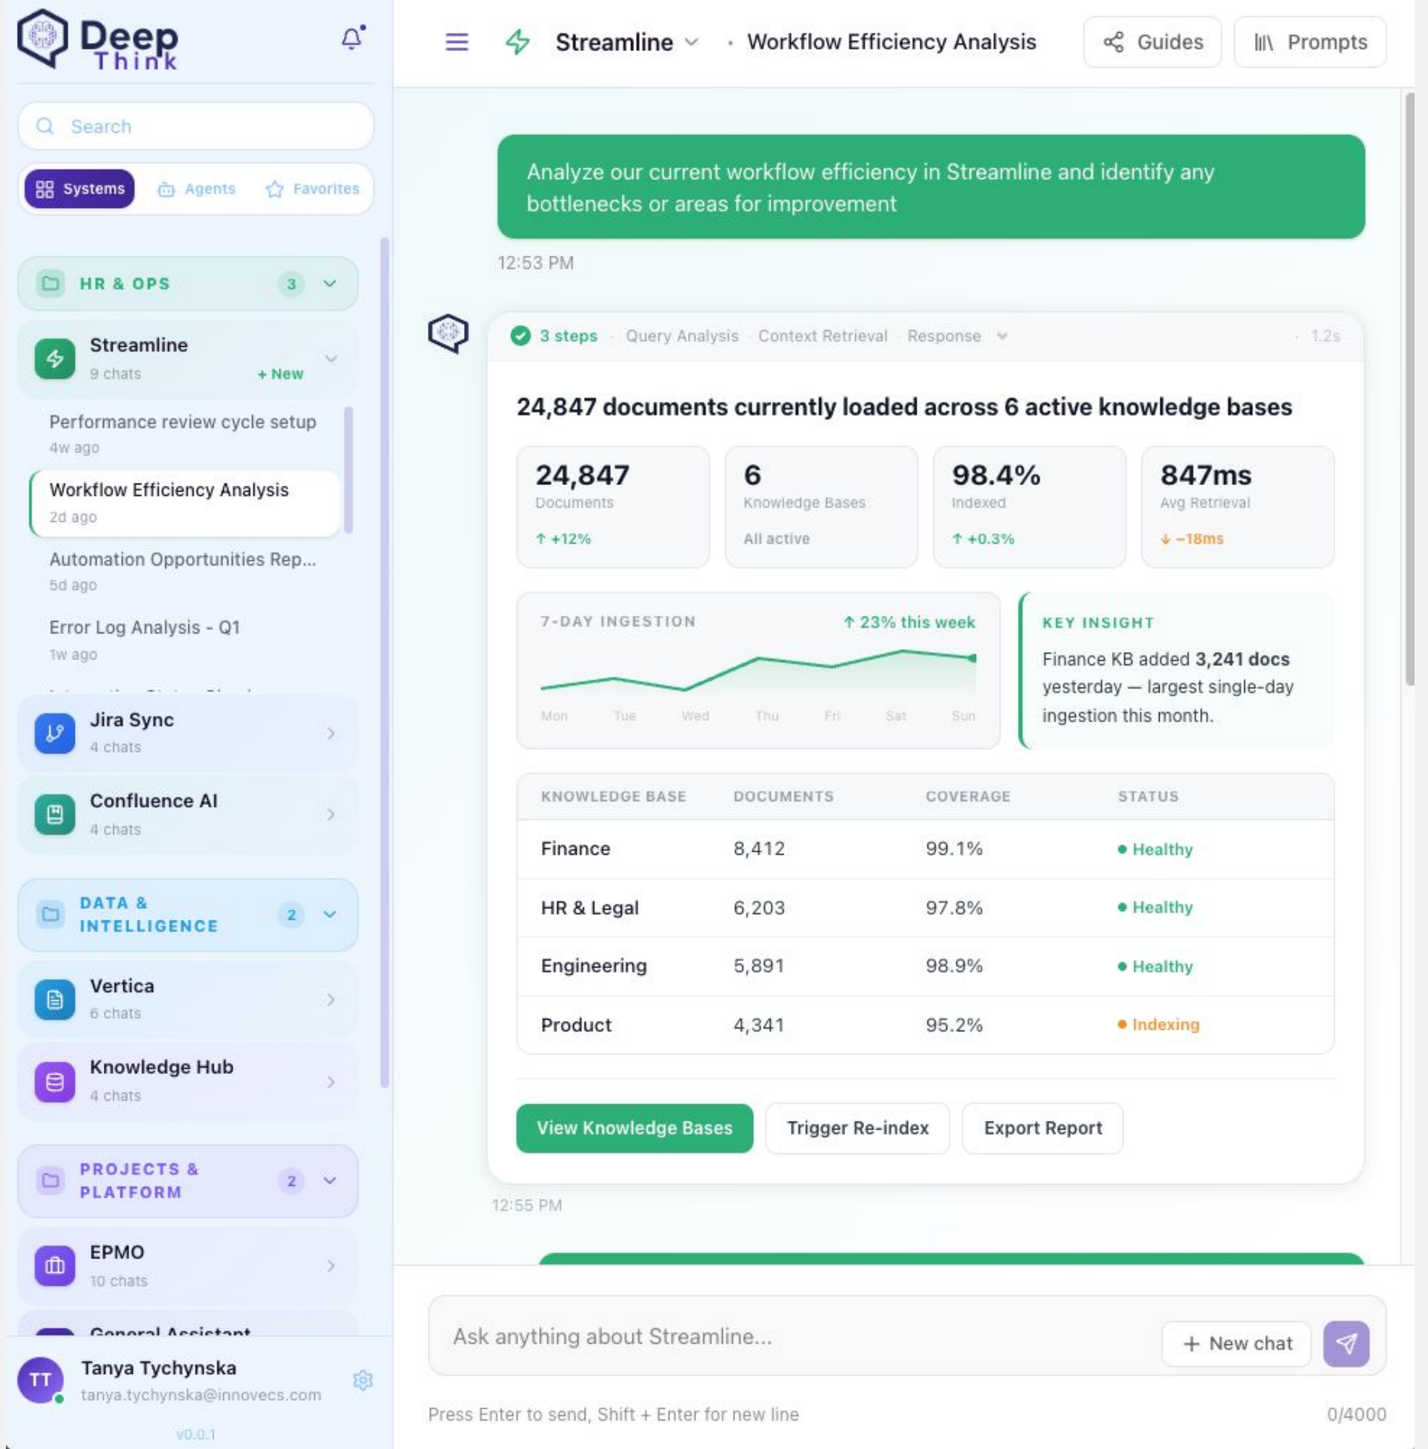

Deep Think

Five shared principles

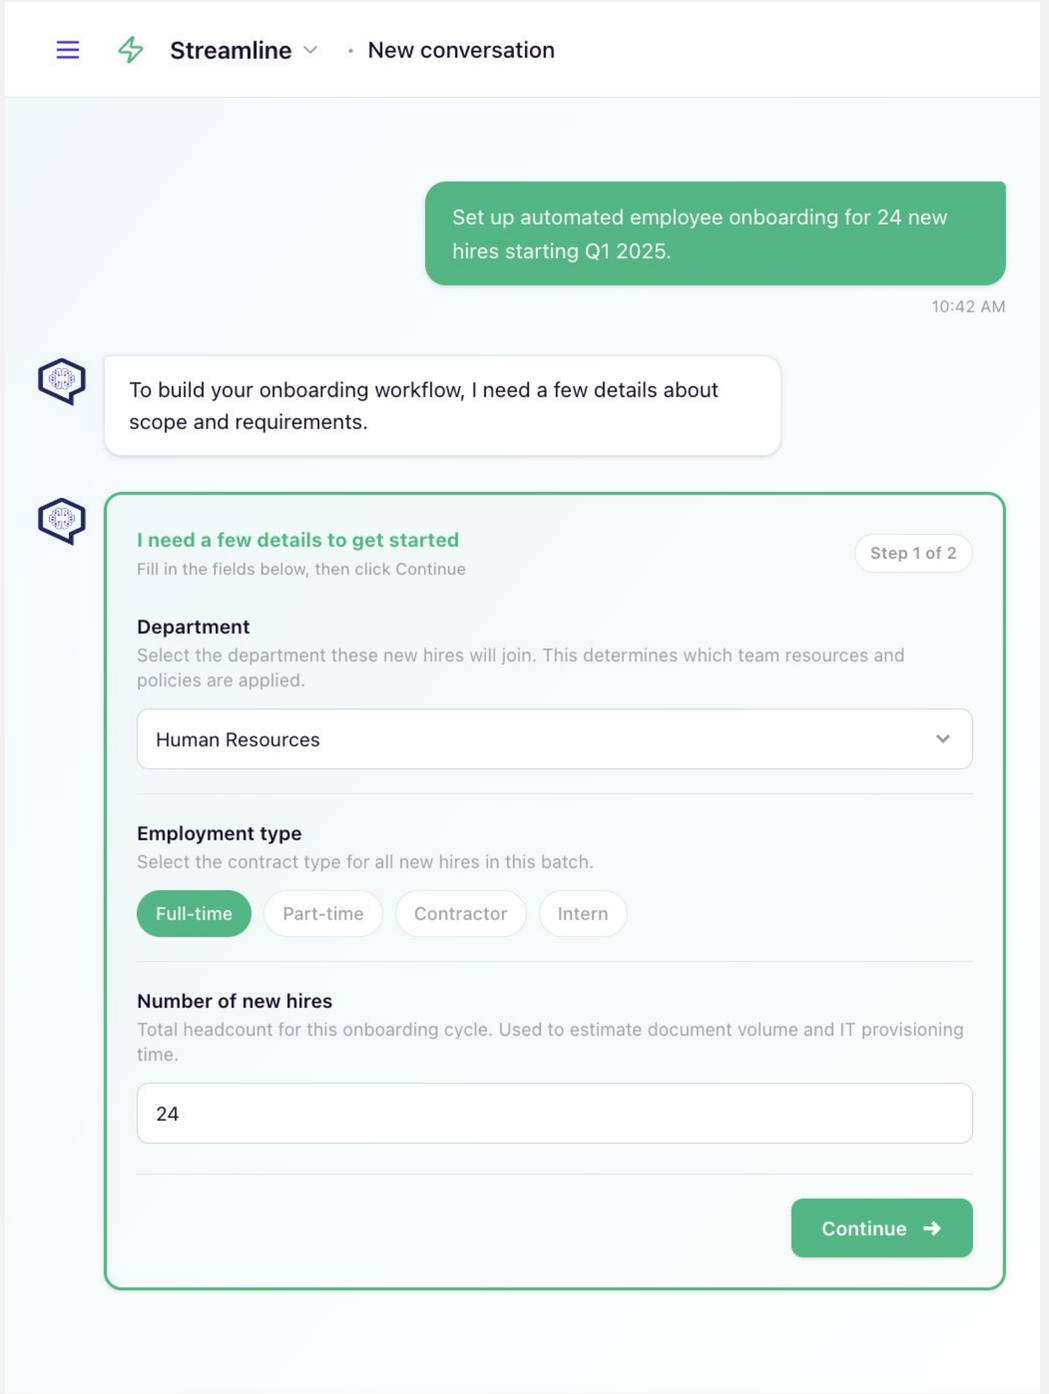

One shell, every agent

- A single sidebar organizes every agent by team, so where you are is never a guess
- Systems, Agents and Favorites stay one tab apart, whichever agent is open
- The canvas is free-form — cards, tables and charts sit alongside the conversation

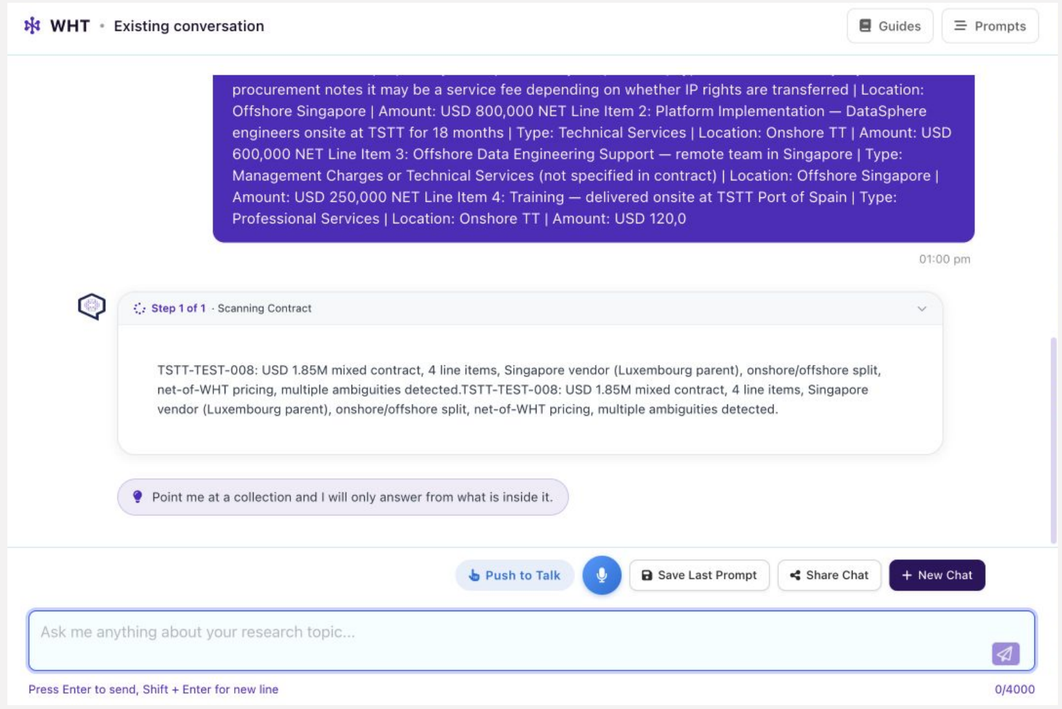

Ask like a form, not a prompt

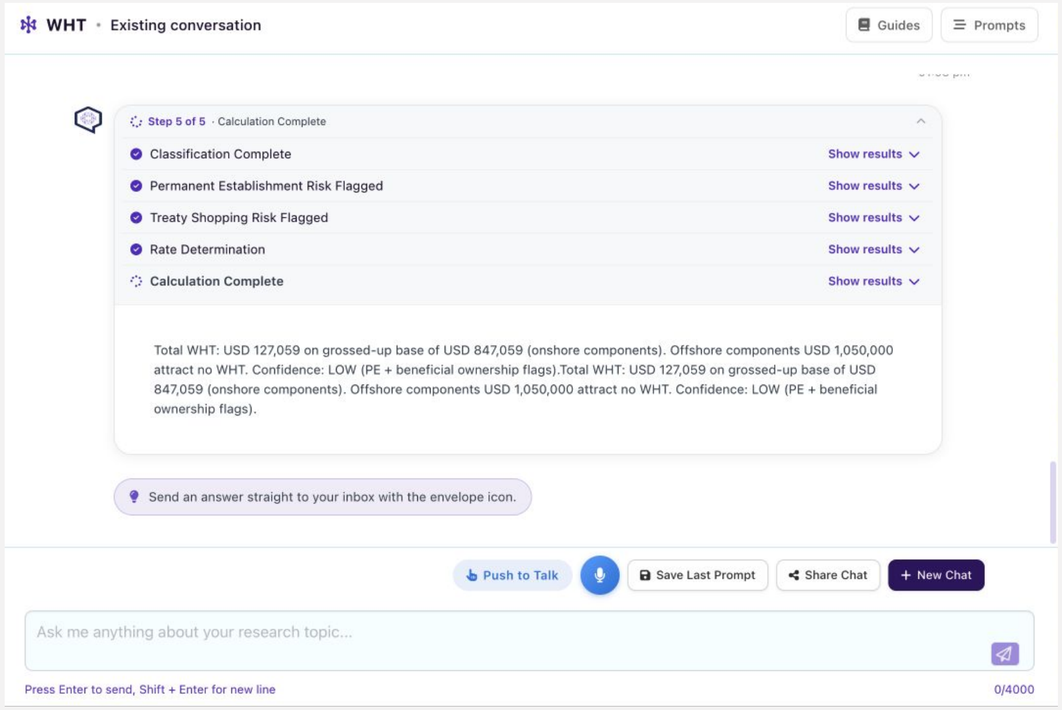

- Structured input renders as fields — dropdowns, toggles, numbers — not a request to type it out
- Every field carries a one-line reason, so the person filling it in knows why it matters
- A visible step count and one Continue action replace open-ended back-and-forth

Show the thinking, one step at a time

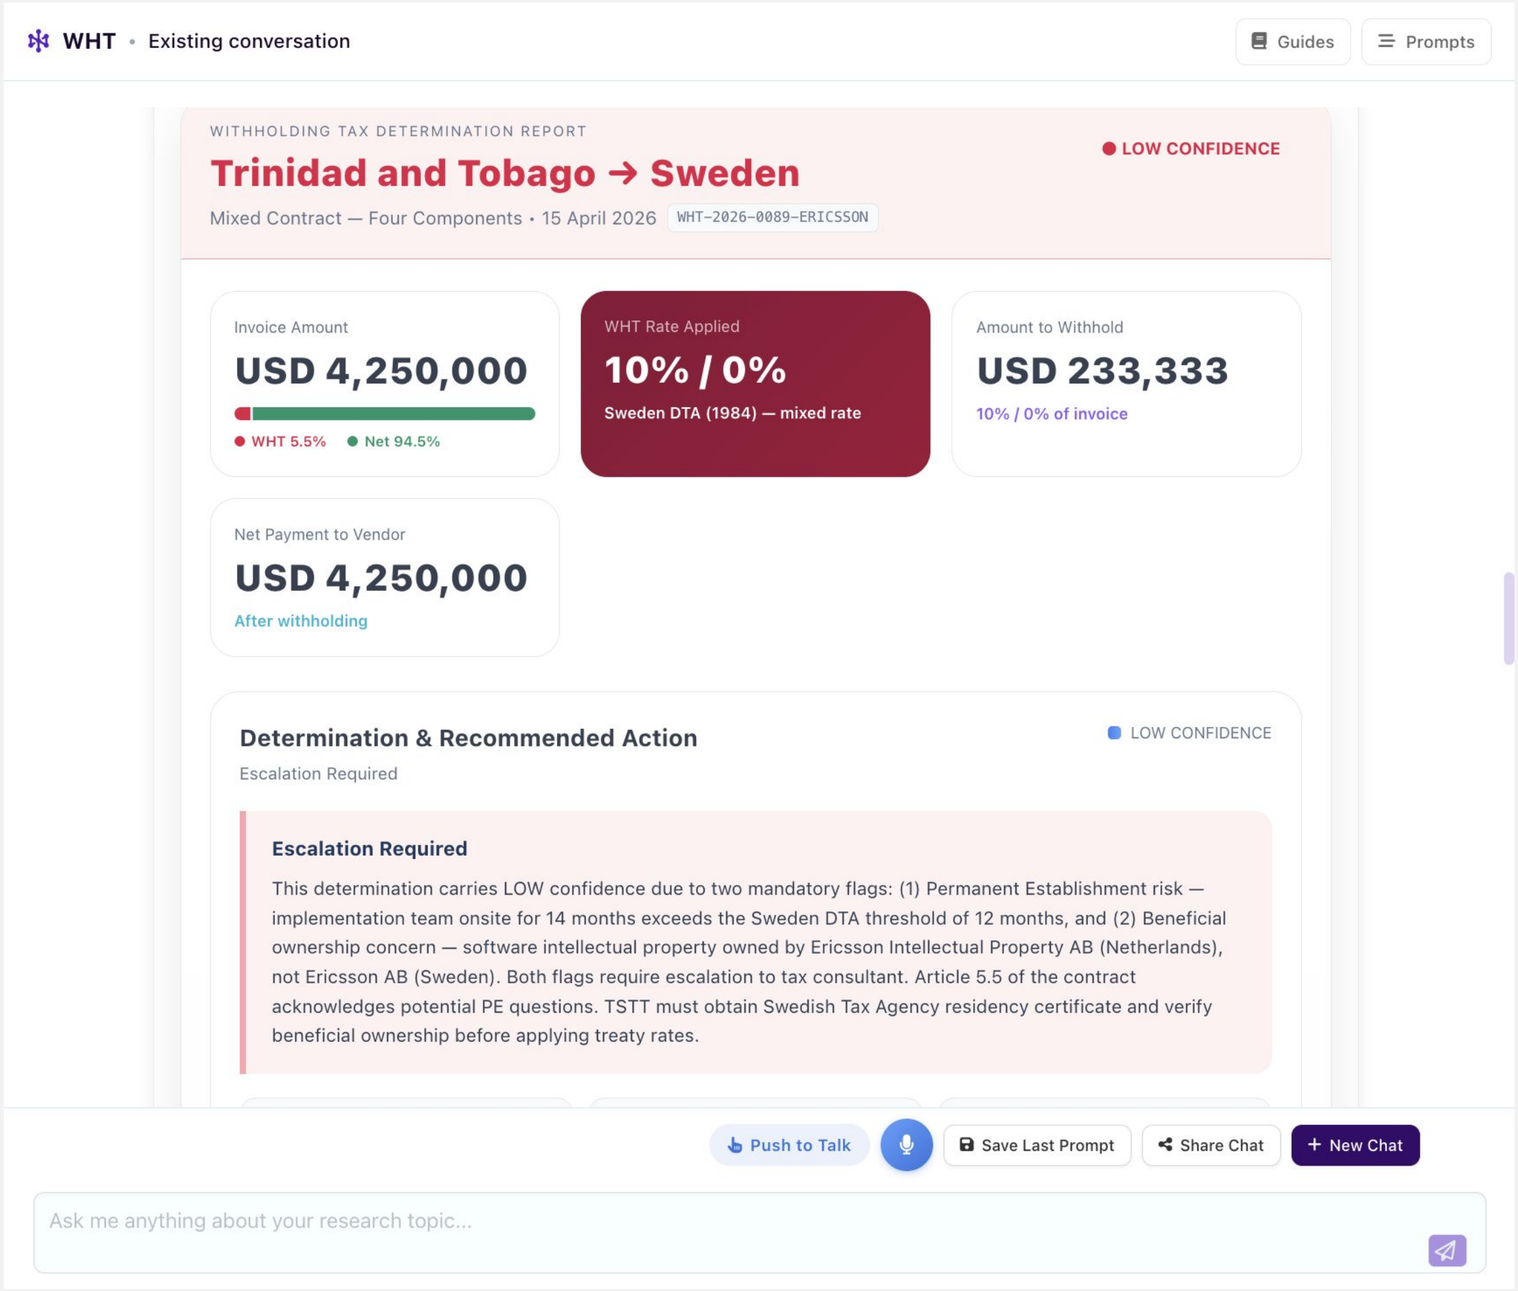

- Long-running work narrates itself — “Step 1 of 1 · Scanning Contract” — then checks off each stage as it completes
- Every stage stays collapsed behind “Show results”; detail is one click away, not dumped on screen
- The user always knows where the agent is, without reading a wall of intermediate output

Confidence and risk carry color

- Every determination states its own confidence — High, Medium or Low — as a tag beside the headline number
- Escalation flags sit in a tinted panel of their own, separated from the numbers they qualify
- The same result / escalation / next-step logic repeats across every report an agent produces

Answers land as reports, not paragraphs

- A completed task closes with a titled artifact — table, metric row or timeline — not a paragraph of prose
- Quotes from the source material stay attached to the insight they support, so the reasoning stays checkable
- The same shape works whether the task is a status table or a tax calculation
